Marks Obtained : 50

Section 1 : Coding

1. Problem Statement

In a voting system, a person must be at least 18 years old to be eligible to vote. If a user enters an age below 18, the system should raise a user-defined exception indicating that they are not eligible to vote.

Input Format

The input contains a positive integer representing age.

Output Format

If the age is less than 18, the output displays "Not eligible to vote".

Otherwise, the output displays "Eligible to vote".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 18

Output: Eligible to vote

Answer

```
class VotingException(Exception):  
    pass
```

```
try:  
    age = int(input())  
    if age < 18:  
        raise VotingException  
    else:  
        print("Eligible to vote")
```

```
except VotingException:  
    print("Not eligible to vote")
```

Status : Correct

Marks : 10/10

2. Problem Statement

A retail store requires a program to calculate the total cost of purchasing a product based on its price and quantity. The program performs validation to ensure valid inputs and handles specific error conditions using exceptions:

Price Validation: If the price is zero or less, raise a ValueError with the message: "Invalid Price". Quantity Validation: If the quantity is zero or less, raise a ValueError with the message: "Invalid Quantity". Cost Threshold: If the total cost exceeds 1000, raise RuntimeError with the message: "Excessive Cost".

Input Format

The first line of input consists of a double value, representing the price of a product.

The second line consists of an integer, representing the quantity of the product.

Output Format

If the calculation is successful, print the total cost rounded to one decimal place.

If the price is zero or less prints "Invalid Price".

If the quantity is zero or less prints "Invalid Quantity".

If the total cost exceeds 1000, prints "Excessive Cost".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 20.0

5

Output: 100.0

Answer

try:

```
price = float(input().strip())
```

```
quantity = int(input().strip())
```

```
if price <= 0:
```

```
    raise ValueError("Invalid Price")
```

```
if quantity <= 0:
```

```
    raise ValueError("Invalid Quantity")
```

```
total_cost = price * quantity
```

```
if total_cost > 1000:
```

```
    raise RuntimeError("Excessive Cost")
```

```
print(f"{total_cost:.1f}")
```

```
except ValueError as e:
```

```
    print(e)
```

```
except RuntimeError as e:
```

print(e)

Status : Correct

Marks : 10/10

3. Problem Statement

Write a program that calculates the average of a list of integers. The program prompts the user to enter the length of the list (n) and each element of the list. It performs error handling to ensure that the length of the list is a non-negative integer and that each input element is a numeric value.

Input Format

The first line of the input is an integer n, representing the length of the list as a positive integer.

The second line of the input consists of an element of the list as an integer, separated by a new line.

Output Format

If the length of the list is not a positive integer or zero, the output displays "Error: The length of the list must be a non-negative integer."

If a non-numeric value is entered for the length of the list, the output displays "Error: You must enter a numeric value."

If a non-numeric value is entered for a list element, the output displays "Error: You must enter a numeric value."

If the inputs are valid, the program calculates and prints the average of the provided list of integers with two decimal places: "The average is: [average]".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: -2

1
2

Output: Error: The length of the list must be a non-negative integer.

Answer

try:

```
n = input().strip()
```

```
if n.lstrip('-').isdigit():
```

```
    n = int(n)
```

```
    if n <= 0:
```

```
        print("Error: The length of the list must be a non-negative integer.")
```

```
    else:
```

```
        numbers = []
```

```
        for _ in range(n):
```

```
            num = input().strip()
```

```
            if not num.lstrip('-').isdigit():
```

```
                print("Error: You must enter a numeric value.")
```

```
                break
```

```
            numbers.append(int(num))
```

```
        if len(numbers) == n:
```

```
            average = sum(numbers) / n
```

```
            print(f"The average is: {average:.2f}")
```

```
    else:
```

```
        print("Error: You must enter a numeric value.")
```

```
except Exception:
```

```
    print("An unexpected error occurred.")
```

Status : Correct

Marks : 10/10

4. Problem Statement

Sophie enjoys playing with words and wants to count the number of words in a sentence. She inputs a sentence, saves it to a file, and then reads it

from the file to count the words.

Write a program to determine the number of words in the input sentence.

File Name: sentence_file.txt

Input Format

The input consists of a single line of text containing words separated by spaces.

Output Format

The output displays the count of words in the sentence.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: Four Words In This Sentence

Output: 5

Answer

```
with open("sentence_file.txt", "w") as file:  
    sentence = input().strip()  
    file.write(sentence)
```

```
with open("sentence_file.txt", "r") as file:  
    content = file.read().strip()  
    word_count = len(content.split()) if content else 0
```

```
print(word_count)
```

Status : Correct

Marks : 10/10

5. Problem Statement

Tara is a content manager who needs to perform case conversions for

various pieces of text and save the results in a structured manner.

She requires a program to take a user's input string, save it in a file, and then retrieve and display the string in both upper-case and lower-case versions. Help her achieve this task efficiently.

File Name: text_file.txt

Input Format

The input consists of a single line containing a string provided by the user.

Output Format

The first line displays the original string read from the file in the format: "Original String: {original_string}".

The second line displays the upper-case version of the original string in the format: "Upper-Case String: {upper_case_string}".

The third line displays the lower-case version of the original string in the format: "Lower-Case String: {lower_case_string}".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: #SpecialSymBoLs1234

Output: Original String: #SpecialSymBoLs1234

Upper-Case String: #SPECIALSYMBOLS1234

Lower-Case String: #specialsymbols1234

Answer

```
with open("text_file.txt", "w") as file:  
    user_input = input().strip()  
    file.write(user_input)
```

```
with open("text_file.txt", "r") as file:  
    content = file.read().strip()
```

```
print(f"Original String: {content}")
```

```
print(f"Upper-Case String: {content.upper()}")  
print(f"Lower-Case String: {content.lower()}")
```

1. Problem Statement

Peter manages a student database and needs a program to add students. For each student, Alex inputs their ID and name. The program checks for duplicate IDs and ensures the database isn't full.

If a duplicate or a full database is detected, an appropriate error message is displayed. Otherwise, the student is added, and a confirmation message is shown. The database has a maximum capacity of 30 students, and each student must have a unique ID.

Input Format

The first line contains an integer n , representing the number of students to be added to the school database.

The next n lines each contain two space-separated values, representing the student's ID (integer) and the student's name (string).

Output Format

The output will depend on the actions performed in the code.

If a student is added to the database, the output will display: "Student with ID [ID number] added to the database."

If there is an exception due to a duplicate student ID, the output will display: "Exception caught. Error: Student ID already exists."

If there is an exception due to the database being full, the output will display: "Exception caught. Error: Student database is full."

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: 3
16 Sam
87 Sabari
43 Dani

Output: Student with ID 16 added to the database.
Student with ID 87 added to the database.
Student with ID 43 added to the database.

Answer

```
MAX_CAPACITY = 30
students = set()
```

```
try:
    n = int(input().strip())
```

```
    for _ in range(n):
        if len(students) >= MAX_CAPACITY:
            raise Exception("Student database is full.")
```

```

line = input().strip()
parts = line.split(maxsplit=1)

if len(parts) != 2:
    raise Exception("Invalid input format")

student_id_str, student_name = parts
student_id = int(student_id_str)

if student_id in students:
    raise Exception("Student ID already exists.")

students.add(student_id)
print(f"Student with ID {student_id} added to the database.", end="\n")

except Exception as e:
    print(f"Exception caught. Error: {e}")

```

Status : Correct

Marks : 10/10

2. Problem Statement

John is a data analyst who often works with text files. He needs a program that can analyze the contents of a text file and count the number of times a specific character appears in the file.

John wants a simple program that allows him to specify a file and a character to count within that file.

Input Format

The first line of input consists of the file's name to be analyzed.

The second line of the input consists of the string they want to write within the file.

The third line of the input consists of a character to count within the file.

Output Format

If the character is found, the output displays "The character 'X' appears {Y} times

in the file." where X is the character and Y is the count,

If the character does not appear in the file, the output displays "Character not found."

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: test.txt

This is a test file to check the character count.

e

Output: The character 'e' appears 5 times in the file.

Answer

```
filename = input().strip()
```

```
content = input()
```

```
char_to_count = input()
```

```
with open(filename, 'w') as f:
```

```
    f.write(content)
```

```
with open(filename, 'r') as f:
```

```
    file_content = f.read()
```

```
count = file_content.lower().count(char_to_count.lower())
```

```
if count > 0:
```

```
    print(f"The character '{char_to_count}' appears {count} times in the file.")
```

```
else:
```

```
    print("Character not found in the file.")
```

3. Problem Statement

Reeta is playing with numbers. Reeta wants to have a file containing a list of numbers, and she needs to find the average of those numbers. Write a program to read the numbers from the file, calculate the average, and display it.

File Name: user_input.txt

Input Format

The input file will contain a single line of space-separated numbers (as a string).

These numbers may be integers or decimals.

Output Format

If all inputs are valid numbers, the output should print: "Average of the numbers is: X.XX" (where X.XX is the computed average rounded to two decimal places)

If the input contains invalid data, print: "Invalid data in the input."

Refer to the sample output for format specifications.

Sample Test Case

Input: 1 2 3 4 5

Output: Average of the numbers is: 3.00

Answer

```
try:
    data = input().strip().split()
    numbers = [float(num) for num in data]
    avg = sum(numbers) / len(numbers)
    print(f"Average of the numbers is: {avg:.2f}")
except ValueError:
    print("Invalid data in the input.")

Section 1 : MCQ

1. What will be the output of the following Python code?

```
f = None
for i in range(5):
    with open("data.txt", "w") as f:
        if i > 2:
            break
print(f.closed)
```

Answer

True

Status : Correct

Marks : 1/1

2. Fill in the blanks in the following code of writing data in binary files.

```

import _____ (1)
rec=[]
while True:
    rn=int(input("Enter"))
    nm=input("Enter")
    temp=[rn, nm]
    rec.append(temp)
    ch=input("Enter choice (y/N)")
    if ch.upper()=="N":
        break
f.open("stud.dat", "_____")(2)
_____.dump(rec,f)(3)
_____.close()(4)

```

Answer

(pickle,wb,pickle,f)

Status : Correct

Marks : 1/1

3. What is the output of the following code?

```

try:
    x = "hello" + 5
except TypeError:
    print("Type Error occurred")
finally:
    print("This will always execute")

```

Answer

Type Error occurredThis will always execute

Status : Correct

Marks : 1/1

4. What is the difference between r+ and w+ modes?

Answer

in r+ the pointer is initially placed at the beginning of the file and the pointer is at the end for w+

Status : Correct

Marks : 1/1

5. How do you create a user-defined exception in Python?

Answer

By creating a new class that inherits from the Exception class

Status : Correct

Marks : 1/1

6. Match the following:

- a) f.seek(5,1) i) Move file pointer five characters behind from the current position
- b) f.seek(-5,1) ii) Move file pointer to the end of a file
- c) f.seek(0,2) iii) Move file pointer five characters ahead from the current position
- d) f.seek(0) iv) Move file pointer to the beginning of a file

Answer

a-iii, b-i, c-ii, d-iv

Status : Correct

Marks : 1/1

7. What happens if an exception is not caught in the except clause?

Answer

The program will display a traceback error and stop execution

Status : Correct

Marks : 1/1

8. Which of the following is true about the finally block in Python?

Answer

The finally block is always executed, regardless of whether an exception occurs or not

Status : Correct

Marks : 1/1

9. Which of the following is true about
fp.seek(10,1)

Answer

Move file pointer ten characters ahead from the current position

Status : Correct

Marks : 1/1

10. What is the output of the following code?

```
try:
    x = 1 / 0
except ZeroDivisionError:
    print("Caught division by zero error")
finally:
    print("Executed")
```

Answer

Caught division by zero errorExecuted

Status : Correct

Marks : 1/1

11. What happens if no arguments are passed to the seek function?

Answer

file position remains unchanged

Status : Correct

Marks : 1/1

12. What will be the output of the following Python code?

```
# Predefined lines to simulate the file content
lines = [
    "This is 1st line",
```

```
"This is 2nd line",  
"This is 3rd line",  
"This is 4th line",  
"This is 5th line"  
]  
  
print("Name of the file: foo.txt")  
  
# Print the first 5 lines from the predefined list  
for index in range(5):  
    line = lines[index]  
    print("Line No %d - %s" % (index + 1, line.strip()))
```

Answer

Displays Output

Status : Correct

Marks : 1/1

13. What is the correct way to raise an exception in Python?

Answer

raise Exception()

Status : Correct

Marks : 1/1

14. What is the purpose of the except clause in Python?

Answer

To handle exceptions during code execution

Status : Correct

Marks : 1/1

15. Fill in the code in order to get the following output:

Output:

Name of the file: ex.txt

```
fo = open(_____(1), "wb")  
print("Name of the file: ", _____)(2)
```

Answer

1) "ex.txt" 2) fo.name()

Status : Wrong

Marks : 0/1

16. Fill the code to in order to read file from the current position.

Assuming exp.txt file has following 3 lines, consider current file position is beginning of 2nd line

Meri,25

John,21

Raj,20

Output:

['John,21\n','Raj,20\n']

```
f = open("exp.txt", "w+")  
_____(1)  
print _____(2)
```

Answer

1) f.seek(0, 1) 2) f.readlines()

Status : Correct

Marks : 1/1

17. What is the default value of reference_point in the following code?

```
file_object.seek(offset [,reference_point])
```

Answer

0

Status : Correct

Marks : 1/1

18. What is the output of the following code?

```
class MyError(Exception):  
    pass  
  
try:  
    raise MyError("Something went wrong")  
except MyError as e:  
    print(e)
```

Answer

Something went wrong

Status : Correct

Marks : 1/1

19. Which clause is used to clean up resources, such as closing files in Python?

Answer

finally

Status : Correct

Marks : 1/1

20. How do you rename a file?

Answer

os.rename(existing_name, new_name)

Status : Correct

Marks : 1/1

1. Problem Statement

In the enchanted realm of Academia, you, the Academic Alchemist, are bestowed with a magical quill and a parchment to weave the grades of aspiring students into a tapestry of academic brilliance.

The mission is to craft a Python program that empowers faculty members to enter student grades for any two subjects, stores these magical grades in a mystical file, and then, with a wave of your virtual wand, calculates the GPA to unveil the true essence of academic achievement.

Input Format

The input format is a string representing the student's name, any two subjects, and corresponding grades.

After entering grades, they can type 'done' when prompted for the student's name.

Output Format

The output should display the (average of grades) calculated GPA with a precision of two decimal places.

The magical grades will be saved in a mystical file named "magical_grades.txt".

Refer to the sample output for format specifications.

Sample Test Case

Input: Alice

Math

95

English

88

done

Output: 91.50

Answer

```
def main():
    filename = "magical_grades.txt"
    with open(filename, "w") as file:
        while True:
            name = input()
            if name.lower() == "done":
                break

            subject1 = input()
            grade1 = float(input())
            subject2 = input()
            grade2 = float(input())

            # Save to file
            file.write(f"{name},{subject1},{grade1},{subject2},{grade2}\n")

            # Calculate GPA
```

```
gpa = (grade1 + grade2) / 2
print(f"{gpa:.2f}")

if __name__ == "__main__":
    main()
```

Marks : 10/10

2. Problem Statement

Alex is creating an account and needs to set up a password. The program prompts Alex to enter their name, mobile number, chosen username, and desired password. Password validation criteria include:

Length between 10 and 20 characters. At least one digit. At least one special character from !@#\$%^&* set. Display "Valid Password" if criteria are met; otherwise, raise an exception with an appropriate error message.

Input Format

The first line of the input consists of the name as a string.

The second line of the input consists of the mobile number as a string.

The third line of the input consists of the username as a string.

The fourth line of the input consists of the password as a string.

Output Format

If the password is valid (meets all the criteria), it will print "Valid Password"

If the password is weak (fails any one or more criteria), it will print an error message accordingly.

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: John
9874563210
john
john1#nhøj

Output: Valid Password

Answer

```
def validate_password(password):  
    special_chars = "!@#$%^&*"   
    if not any(char.isdigit() for char in password):  
        raise Exception("Should contain at least one digit")  
    if not any(char in special_chars for char in password):  
        raise Exception("It should contain at least one special character")  
    if len(password) < 10 or len(password) > 20:  
        raise Exception("Should be a minimum of 10 characters and a maximum of  
20 characters")  
    print("Valid Password")
```

```
def main():  
    try:  
        name = input()

        username = input()  
        password = input()  
        validate_password(password)  
    except Exception as e:  
        print(e)  
  
if __name__ == "__main__":  
    main()
```

Status : Partially correct

Marks : 6.5/10

3. Problem Statement

Write a program to read the Register Number and Mobile Number of a student. Create user-defined exception and handle the following:

If the Register Number does not contain exactly 9 characters in the specified format(2 numbers followed by 3 characters followed by 4

numbers) or if the Mobile Number does not contain exactly 10 characters, throw an `IllegalArgumentException`. If the Mobile Number contains any character other than a digit, raise a `NumberFormatException`. If the Register Number contains any character other than digits and alphabets, throw a `NoSuchElementException`. If they are valid, print the message 'valid' or else print an Invalid message.

Input Format

The first line of the input consists of a string representing the Register number.

The second line of the input consists of a string representing the Mobile number.

Output Format

The output should display any one of the following messages:

If both numbers are valid, print "Valid".

If an exception is raised, print "Invalid with exception message: ", followed by the specific exception message.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 19ABC1001

9949596920

Output: Valid

Answer

```
import re
```

```
# Custom Exceptions
```

```
class IllegalArgumentException(Exception):  
    pass
```

```
class NumberFormatException(Exception):  
    pass
```

```

        validate_mobile_number(mobile_no)

        print("Valid")

    except Exception as e:
        print(f"Invalid with exception message: {e}")

if __name__ == "__main__":
    main()

```

Status : Correct

Marks : 10/10

4. Problem Statement

Bob, a data analyst, requires a program to automate the process of analyzing character frequency in a given text. This program should allow the user to input a string, calculate the frequency of each character within the text, save these character frequencies to a file named "char_frequency.txt," and display the results.

Input Format

The input consists of the string.

Output Format

The first line prints "Character Frequencies:".

The following lines print the character frequency in the format: "X: Y" where X is the character and Y is the count.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: aaabbbccc

Output: Character Frequencies:

a: 3

b: 3

c: 3

Answer

```
from collections import OrderedDict
```

```
def main():  
    text = input()  
    freq = OrderedDict()  
    for char in text:  
        if char in freq:  
            freq[char] += 1  
        else:  
            freq[char] = 1
```

```
with open("char_frequency.txt", "w") as file:
    for char, count in freq.items():
        file.write(f"{char}: {count}\n")
    print("Character Frequencies:")
    for char, count in freq.items():
        print(f"{char}: {count}", end=" ")
    print()
```

```
if __name__ == "__main__":
    main()
```
